Observation of High-speed Outflow on Plume-like Structures of the Quiet Sun and Coronal Holes with SDO/AIA

H. Tian¹, S. W. McIntosh¹, S. R. Habbal², J.-S. He³
¹National Center for Atmospheric Research ²University of Hawaii ³Peking University

SHINE session:
What is a coronal hole?

- Plume-like structures not only in polar CHs, but also in ECH and QS regions
- Quasi-periodic upward propagating disturbances (likely outflows) along plumes in both QS & CH
- Blueshifts in CHs largely contaminated by outflows from QS, not pure signatures of solar wind from CHs
